PART ONE · THE FOUNDATION

Compounding with 10x AI

THE GUIDE · SMALL CAPITAL & BIG CAPITAL

Turn what you have into what you want

· BY 10X AI ·

What is inside

Part Two of this guide — advanced stake management and multi-pair compounding — is coming soon.

1 · What compounding is

Compounding is the snowball effect, applied to money. **Your profits stay in the account, and every next trade is sized off the new, larger balance.** You are not chasing big wins — you are letting steady growth build on itself, day after day.

A snowball starts small. Roll it once and it picks up a little snow. Roll it again and it picks up more, because the ball itself is bigger. That is exactly how a compounded account behaves: the first week looks small, the third week looks different, and by the end of the cycle the growth is happening faster than anyone expected.

> *"Most traders lose the same way: they risk too much, lose it, then chase the loss with a bigger bet. Compounding is the opposite — small, consistent, and relentless."*

Why compounding beats big bets

A single big trade can win — or it can wipe out a week of progress in one candle. A compounded account never depends on a single moment. It depends on **time in the market with the winnings in play.** That is why the method matters more than the market: the market moves every day, but only the compounding account turns those moves into permanent growth.

Nothing is guaranteed and no system is perfect — this guide gives growth its best chance, it does not remove risk from trading.

2 · The mechanics on IQ Option

You trade OTC pairs — EURUSD-OTC, GBPUSD-OTC, AUDUSD-OTC and the rest — on short timeframes. Every trade is a binary option: you predict whether the price finishes **above (Higher / BUY)** or **below (Lower / SELL)** when the timer expires.

The payout

OTC pairs pay roughly **86%** on a winning trade. Stake $100, win, and you receive your $100 back plus $86 profit. Lose, and you lose the stake. That asymmetry — 86% for a win, 100% for a loss — is why stake size is the trader's real edge: it decides how much a streak of wins grows the account and how much a streak of losses shrinks it.

Two numbers decide everything

Number	Who owns it	Why it matters
Win rate	The engine (10x AI)	How often the direction is right
Stake size	You	The % of balance per trade — the growth dial

WHY STAKE SIZE MATTERS MORE THAN WIN RATE

At 86% payout and a 60% win rate, a 2% stake nets roughly +0.23% per trade on average. A 10% stake with the same win rate nets +1.16% per trade — but one losing streak of four trades costs −34% of the account. **Small stakes survive the streaks; large stakes die before the streak ends.**

The engine finds the direction. The method decides the stake. Together they compound.

3 · The formula and the curves

This is the engine room of the whole idea:

THE COMPOUND FORMULA

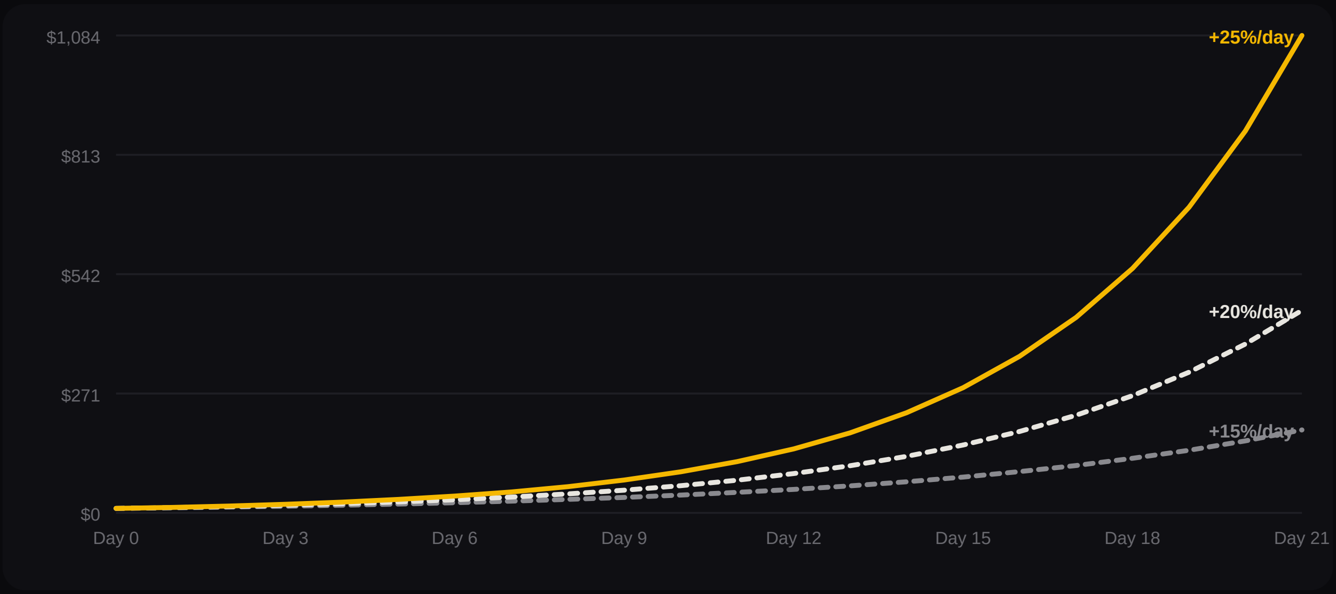
Balance after N days = Start × (1 + daily growth)^{N}

\$10 at +25% a day → 10 × 1.25^{21} = **\$1,084**

\$100 at +25% a day → 100 × 1.25^{21} = **\$10,843**

\$1,000 at +15% a day → 1,000 × 1.15^{21} = **\$15,289**

Notice the pattern: the same curve that turns \$10 into \$1,000 turns \$100 into \$10,000. **The size of the start changes, the shape of the journey does not.**



Three compounding curves from \$10 over a 21-day cycle. The difference between +15% and +25% a day is the difference between patience and a goal.

4 · The four steps of the method

Every cycle — small or big — runs the same four steps. This is the routine. Nothing else is required.

STEP 1 — SECURE CAPITAL

Fund the account with money that stays untouched for the cycle. It is not spending money; it is working capital with a job to do.

STEP 2 — TRADE ONLY THE PROFIT

The base stays protected. Only the profit the engine generates is used to take the next trade. The base never shrinks; it only ever grows.

STEP 3 — FIXED DURATION

Choose the cycle length up front — two weeks or three. No early exits, no skipped days, no changing the rules halfway. The engine runs the same schedule every day.

STEP 4 — NO WITHDRAWALS

The compound is the whole point. Nothing leaves the account until the goal lands. Withdrawals are the end-of-cycle reward, not a mid-cycle habit.

> *"The engine handles the analysis. You handle the patience. That is the entire division of labour."*

5 · Small capital playbook — $10, $50, $500

Small capital is the best place to start, because the method is identical at every size — and the account gets to prove itself while the risk is tiny. **Small accounts are not small opportunities; they are the same curve, starting lower.**

Your setup

- Product: **Private Trader** (guided) or **Autopilot** (automated)
- Pair: one liquid OTC pair you stay with (EURUSD-OTC is the default)
- Timeframe: 1m or 2m — short enough to compound daily
- Stake: **1–2% of the balance**, recalculated every day
- Daily loss stop: **−8%** — the day ends there, the cycle continues tomorrow

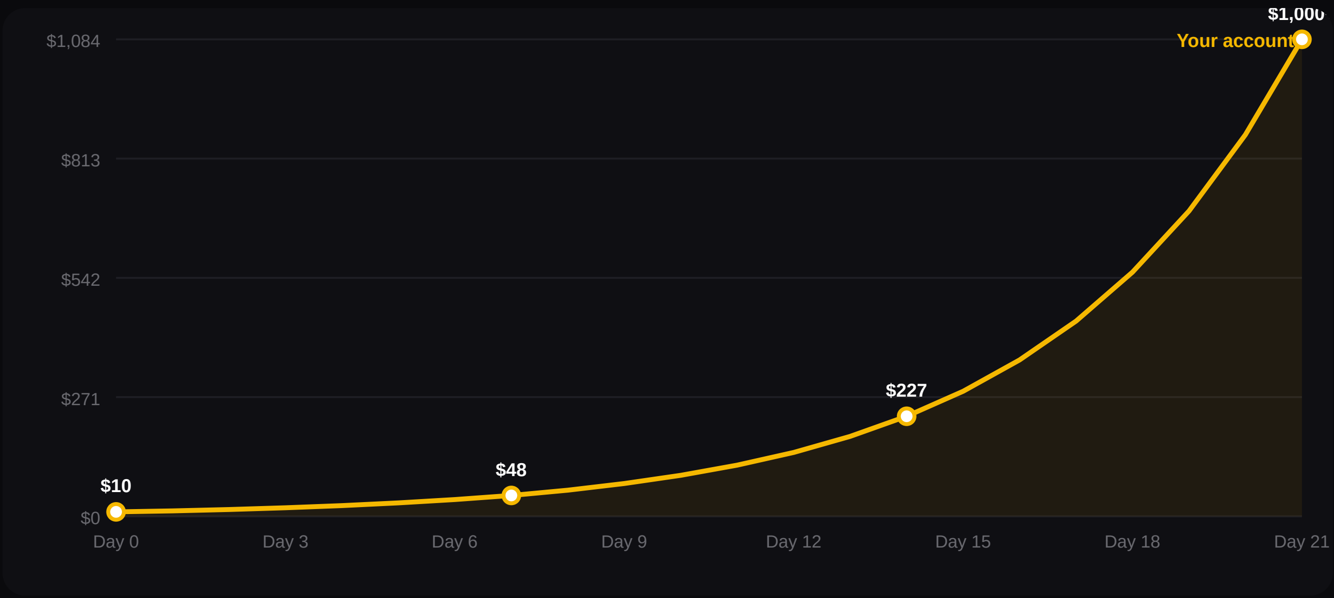
The daily routine

1. **Check the balance.** The stake is 2% of whatever it is today — not what it was last week.
2. **Trade the engine's setups.** Recommended asset and timeframe, or let Autopilot run the session.
3. **Stop at the daily limit.** −8% means the session is over. Tomorrow is another session.
4. **Reinvest every win.** Profit stays in; the next stake is 2% of the new balance.

The routine is the strategy. Skip a day and the curve skips with it.

5 · The $10 journey

This is the journey the guide keeps returning to, because it proves the point: **the start size is not the ceiling.** A $10 account following the routine:



Day	Account	Milestone
0	$10	The start — one funded account
7	$48	Almost 5x in one week
14	$227	20x — the curve is alive
21	$1,084	100x — the goal lands

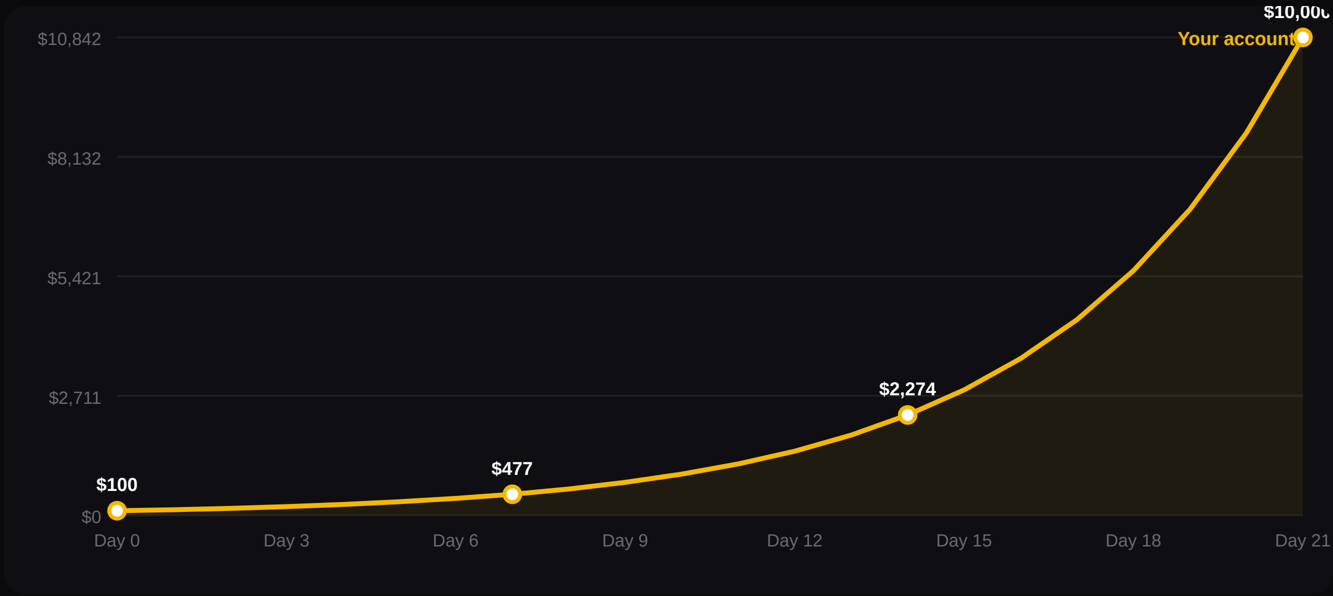
THE SAME CURVE, BIGGER START

Start	+25%/day, 21 days	The milestone
$10	$1,084	Your first $1,000
$50	$5,421	Your first $5,000
$100	$10,843	Your first $10,000
$500	$54,215	A serious account

Illustrative compounding paths at consistent daily growth with the engine's setups — the shape of the curve, not a promise of any specific result.

5 · The $100 journey — the first $10,000

$100 is the most common starting point, and it is the one the curve rewards most visibly. Follow the routine, protect the base, and the milestones come in order:



Week	Account	What happened
Week 1	$477	The base is protected, the winnings are compounding
Week 2	$2,274	The curve is visibly alive — 20x territory
Week 3	$10,843	The goal: your first $10,000 account

> *"Nobody looks at a $100 account and imagines $10,000. That is exactly why the curve works — it does not need anyone to believe it."*

Illustrative compounding path. Some weeks run ahead of the curve, some behind — the method absorbs both.

6 · Big capital playbook — $1,000 and above

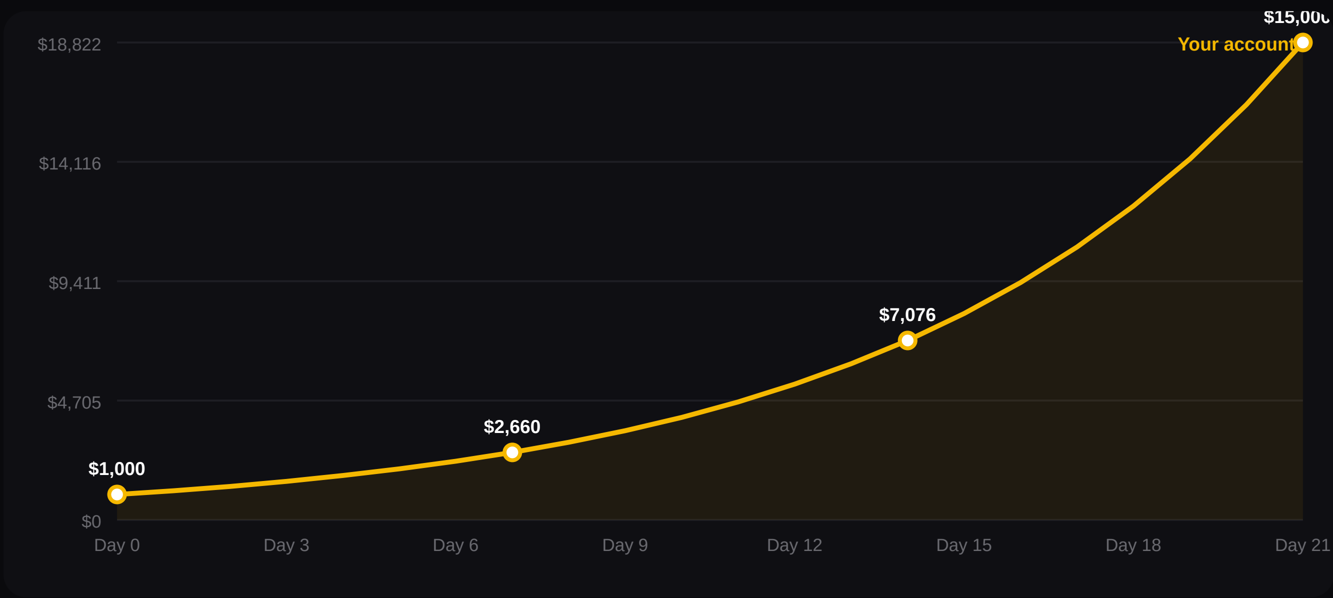
Big capital has a different job: **protect the base, grow it steadily, and let time make it serious.** Speed is not the point — a 5–8% weekly routine on $5,000 is already $250–$400 a week, compounding while you live your life.

Your setup

- Product: **Autopilot** as the base; Private Trader for your own sessions
- Pairs: 2–3 OTC pairs — spread the engine's reads, never one basket
- Timeframe: 1m / 2m / 5m mix
- Stake: **0.5–1% of the balance** per trade
- Daily loss stop: **−5%**, hard

The differences from small capital

- You **spread across pairs** — one pair's bad session does not touch the others
- You **withdraw only the excess** above your base once the cycle ends — the base always stays
- You **never raise the stake to recover** — at this size, recovery attempts are how accounts die



Week	$1,000 account	$5,000 account
0	$1,000	$5,000
1	$2,660	$13,300
2	$7,076	$35,380
3	$15,289	$76,445

Illustrative compounding paths. The base stays protected; the curve does the rest.

7 · The cycle — two or three weeks, one goal

Every compounding run is a **cycle with a duration and a goal**. Two weeks or three — you choose at the start, and the cycle runs until the goal lands. A goal without a date is a wish; a goal with a date is a plan.

The goal is the finish line.

RULE 1 — NO WITHDRAWALS UNTIL THE GOAL IS MET

The compound works because the money stays in play. Every dollar withdrawn mid-cycle is a dollar that stops growing — and a little bit of the curve that never happens. **Nothing leaves the treasury until the goal lands.** That is the deal you make with yourself on day one.

RULE 2 — FALL SHORT? TOP UP AND CONTINUE

Some weeks are lighter than others — that is trading, not failure. If the cycle is running behind, the best move is not to abandon it: **top up the account and keep the goal alive.** The engine keeps trading, the method keeps compounding, and the cycle finishes — the same goal, the same rules, just more runway.

RULE 3 — THE BASE NEVER RISKS MORE THAN THE RULE

Stake percentage is fixed. The loss stop is fixed. The duration is fixed. Only the balance is allowed to grow.

Three rules. They fit on one line and they carry the entire method.

8 · What breaks the cycle

Every account that died did so through one of these. Read them until they are boring — boring is safe.

- **Withdrawing early.** The fastest way to kill a compounding run. The goal is not met until the cycle says so.
- **Raising the stake because you feel hot.** The stake rises with the balance — never with emotion. Feeling hot is not a strategy.
- **Chasing a red day.** The daily loss stop exists so one bad day cannot become a bad month.
- **Doubling to recover.** One lost trade is one lost trade. Recovery with size is how accounts die in a single afternoon.
- **Quitting the cycle at week one.** The first week is the smallest week. The curve does the work later.
- **Trading every signal.** More trades is not more profit. The loss stop protects you from yourself.
- **Forgetting the goal.** Write it down. $10 → $1,000. $100 → $10,000. It is the reason the rules exist.

> *"The account that stays in the cycle is the account that compounds. Everything else is noise."*

9 · Your cycle checklist

When	Action
Day 1	Set the goal and the duration (2 or 3 weeks). Fund the account. Stake = rule%.
Daily	Engine setups → stake off the current balance → stop at the daily loss limit.
Weekly	Log the week: wins, losses, net %. Recalculate the stake on the new balance.
Goal not met	Top up, keep the cycle running, continue compounding.
Goal met	Withdraw the growth. Start the next cycle from the new base.

9 · Quick answers

Can I compound with $10?

Yes — and it is the most honest way to learn the method. The stake is tiny, the risk is tiny, and the curve is identical to the one a $500 account follows. Protect the account and the percentages do the work.

What if I have a red week?

You stop at the daily loss stop, log it, and continue next week from the new balance. The stake recalibrates automatically because it is a percentage.

Autopilot or Private Trader?

Autopilot compounds while you are away — best for big capital consistency. Private Trader builds the discipline — best for small capital learning the method. Most serious compounders run both.

How long is a cycle?

Two weeks or three — you choose on day one. The cycle ends when the goal lands, and the new cycle starts from the new base.

Is this guaranteed?

No. Nothing is guaranteed, and no system is perfect. This guide reduces the risk of losing your base and gives growth its fair chance — it does not remove risk from trading.
