Compounding with 10x AI

THE GUIDE · SMALL CAPITAL & BIG CAPITAL

Turn what you have into what you want

· BY 10X AI ·

What compounding is

Compounding is simple: **your profits stay in the account**, and every next trade is sized off the new, larger balance. You are not chasing big wins — you are letting steady growth build on itself.

The first week looks small. The third week looks different. That is the whole point.

THE FORMULA

Balance after N days = Start $\times$ (1 + daily growth)^N

\$10 at +25% a day $\rightarrow 10 \times 1.25^{21} = \mathbf{\$1,084}$

\$500 at +20% a day $\rightarrow 500 \times 1.2^{21} = \mathbf{\$23,000}$

\$1,000 at +8% a day $\rightarrow 1,000 \times 1.08^{21} = \mathbf{\$5,034}$

These are the curves the engine runs on. The market moves every day — **the compounding is what turns movement into growth.**

Compounding curves for a \$10 account over a 21-day cycle. The difference between +15% and +25% a day is the difference between patience and a goal.

Small capital — start with \$10, \$50, or \$500

Small capital is the best place to start, because the method is the same at every size — and the account gets to **prove itself while the risk is tiny**.

The plan

- Stake: **1–2% of the balance** per trade, recalculated daily
- Timeframe: 1m / 2m OTC — the engine's daily rhythm
- Daily loss stop: **–8%**. The day ends there. The cycle continues tomorrow.

The \$10 journey

Day	Account	Milestone
0	\$10	The start
7	\$48	Almost 5x
14	\$227	20x — the curve is alive
21	\$1,084	100x — goal met

Illustrative compounding path — consistent daily growth with the engine's setups. Not a guarantee; every day the engine trades, the balance decides the next stake.

Big capital — \$1,000 and above

Big capital has a different job: **protect the base, grow it steadily, and let time make it serious**. Speed is not the point — a 5–8% weekly routine on \$5,000 is already \$250–\$400 a week, compounding.

The plan

- Stake: **0.5–1% of the balance** per trade
- Pairs: 2–3 OTC pairs — spread the engine's reads
- Daily loss stop: **–5%**, hard
- Withdrawals: **only after the goal** — the base never leaves the account mid-cycle

Week	\$1,000 account	\$5,000 account
0	\$1,000	\$5,000
1	\$1,398	\$6,988
2	\$1,953	\$9,767
3	\$2,730	\$13,650

Illustrative — the compounding path at a steady daily rate. The engine does the entries; the plan does the protection.

The cycle — 3 weeks, one goal

Every compounding run is a **cycle with a duration and a goal**. Two weeks or three — you choose at the start, and the cycle runs until the goal is met.

The goal is the finish line.

RULE 1 — NO WITHDRAWALS UNTIL THE GOAL IS MET

The compound works because the money stays in play. Every dollar you withdraw mid-cycle is a dollar that stops growing. **Nothing leaves the account until the goal lands.** That is the deal you make with yourself on day one.

RULE 2 — FALL SHORT? TOP UP AND CONTINUE

Some weeks are lighter than others — that is trading. If the cycle is running behind, the best move is not to abandon it: **top up the account and keep the goal alive.** The engine keeps trading, the plan keeps compounding, and the cycle finishes.

RULE 3 — THE BASE NEVER RISKS MORE THAN THE RULE

Stake % is fixed. Loss stop is fixed. Duration is fixed. Only the balance grows.

What breaks the cycle

- **Withdrawing early.** The single fastest way to kill a compounding run. The goal is not met until the cycle says so.
- **Raising the stake because you feel hot.** The stake rises with the balance — never with emotion.
- **Chasing a red day.** The daily loss stop exists so one bad day cannot become a bad month.
- **Quitting the cycle at week one.** The first week is the smallest week. The curve does the work later.
- **Forgetting the goal.** Write it down. \$10 → \$1,000. \$500 → \$5,000. It is the reason the rules exist.

"The account that stays in the cycle is the account that compounds. Everything else is noise."

Your cycle checklist

When	Action
Day 1	Set the goal and the duration (2 or 3 weeks). Fund the account. Stake = rule%.
Daily	Engine setups → stake off current balance → stop at the daily loss limit.
Weekly	Log the week. Recalculate the stake on the new balance. Keep the rules.
Goal not met	Top up, keep the cycle running, continue compounding.
Goal met	Withdraw the growth. Start the next cycle from the new base.

START YOUR CYCLE

1. Create your account — iqbroker.com/lp/regframe-01-light-nosocials/?aff=749367
2. Fund it. 3. Connect to 10x AI — t.me/Shiloh10xbot (2 minutes)
4. Set your goal and duration. The engine trades. The plan compounds.

Nothing is guaranteed, and no system is perfect. What this guide gives you is a method that protects the base, keeps the winnings in play, and gives growth its best chance — **cycle after cycle.**
